Did Santa Get Stuck In The Chimney?

[*Last week*](#), we discussed that the selloff heading into Christmas was the setup for the beginning of the year-end *?Santa Claus?* rally. On Christmas Eve, Santa arrived, pushing the markets back above the important 50-DMA. However, the market sold off on Friday to successfully retest the 50-DMA. While it may seem that the *?Santa Rally?* stalled, I suspect that we could see some buying next week as portfolio window dressing concludes and traders position portfolios in the first two days of January.

As shown, momentum and relative strength are weak currently, but if the market can break back above the 20-DMA, this should bring buyers into the market. As we noted previously, the sell signal keeps a lid on price appreciation, and until that reverses, there is limited upside to the markets over this week. There is also the 24% possibility that a rally fails to materialize entirely. We suggest managing portfolio risk until the market ultimately makes a decisive move.

We continue to monitor yield spreads, which remain near the lowest level since the *Financial Crisis*. When yield spreads were this low previously, this equated to excessive optimism about financial market conditions. This is the same currently, as investors are willing to overpay for the risk they are taking on. Unfortunately, such has not ended well previously, but yield spreads will be the leading indicator for investors to reduce portfolio risk more aggressively.

For now, optimism remains high. But as we will discuss today, that is also a problem we need to monitor closely.

Is Optimism Too Optimistic For 2025?

In [2025 Predictions](#), we showed some early indications of Wall Street targets for the S&P 500 index, and, as is always the case, optimism for the coming year is very high. The median estimate is for the market to rise to 6600 next year, which would be a disappointing return of just 8.2% after two years of 20% plus gains. However, the high estimate from Wells Fargo suggests a 14% return, with the low estimate from UBS of just a 5% return. **Notably, there is not one estimate available for a negative return.**

WALL STREET YEAR-END 2025 TARGETS FOR S&P 500		
Firm	S&P 500 Target	% Above 2023 Close
Wells Fargo	7007	14.87%
Deutsche Bank	7000	14.75%
Yardeni Research	7000	14.75%
BMO	6700	9.84%
Bank Of Montreal	6700	9.84%
Bank of America / Merrill Lynch	6666	9.28%
RBC	6600	8.20%
Barclays Bank	6600	8.20%
Evercore ISI	6600	8.20%
JP Morgan	6500	6.56%
Goldman Sachs	6500	6.56%
Morgan Stanley	6500	6.56%
UBS	6400	4.92%
Median Target		6600 8.20%
Closing Price* (*Estimate)		6100

as of 12/08/24

Interestingly, optimism for 2025 has taken on an interesting twist. Over the last two years of above-average returns, earnings growth has come from just the top-7 market capitalization companies in the S&P 500 index. However, analysts now expect earnings to shift from the bottom 493 companies in the index.

Earnings growth

Pro-forma EPS, y/y

Posted on

The Daily Shot

16-Dec-2024

The optimism in these assumptions is interesting because the economy has grown strongly over the last two years, yet those 493 companies could not grow earnings. What will change in 2025? Yes, President Trump has promised to extend the Tax Cuts and Jobs Act, but that doesn't change the previous tax rate in the last two years. He has proposed to remove tax on tips and social security, but that impacts only a small percentage of the population.

On the other hand, depending on the scale and areas of impact, deregulation could improve earnings, but much of that will have to be passed through Congress, which could prove difficult. The Federal Reserve hopes to continue to cut interest rates, but sticky inflation could slow that process, particularly if economic growth remains strong into 2025. Even if the economy continues to grow strongly, what will cause the shift in earnings growth from those dominant market players to much smaller companies? Such is particularly the case given the continued reversal of monetary liquidity in the economy, with higher borrowing costs and declining consumer savings rates.

However, while analyst's optimism about earnings growth in 2025 is high, which would take earnings well above the long-term growth trend, those estimates are already reversing toward reality. In the last six months, estimates have dropped by \$3 per share and will likely be closer to \$220 per share by next year. As shown, earnings tend not to deviate from the long-term trend for long, and typically, those deviations only occur during recessions and immediate recoveries.

Earnings Forecast Remain Very Optimistic

As [discussed recently](#), if earnings revert toward the long-term trend, which should be expected given that earnings are a function of economic growth, the current valuations become more problematic.

?While the bullish optimism is possible, that outcome faces many challenges in 2025, given the market already trades at fairly lofty valuations. Even in a soft landing environment, earnings should weaken, which makes current valuations at 27x earnings more challenging to sustain. Therefore, assuming earnings decline toward their long-term trend, that would suggest current estimates fall to \$220/share by the end of 2025. This substantially changes the outlook for stocks, with the most bullish case being 6380, assuming a roughly 4.5% gain versus every other outcome, providing losses ranging from a 2.6% loss to a 20.6% decline.?

Reduced Earnings Valuation Estimates

But again, those assumptions are based on a continued moderation in economic growth.

Data Suggests A Continued Moderation In Economic Growth

However, to justify the optimism for increased earnings growth, we must also expect that:

1. *Economic growth remains more robust than the average 20-year growth rate.*
2. *Wage and labor growth must reverse (weaken) to sustain historically elevated profit margins.*
3. *Both interest rates and inflation need to decline to support consumer spending.*
4. *Trump's planned tariffs will increase costs on some products and may not be fully offset by replacement and substitution.*
5. *Reductions in Government spending, debt issuance, and the deficit subtract from corporate profitability (**Kalecki Profit Equation**).*
6. *Slower economic growth in China, Europe, and Japan reduces demand for U.S. exports, slowing economic growth.*
7. *The Federal Reserve maintaining higher interest rates and continuing to reduce its balance sheet will reduce market liquidity.*

You get the idea. While optimism about economic and earnings growth is elevated going into 2025, there are risks to those forecasts. Such is particularly true when examining current economic data's relative strength and trend. Subdued manufacturing activity, slowing GDP growth, and cautious consumer behavior all point to an economic environment less supportive of

aggressive earnings growth. As such, investors must carefully navigate the disconnect between high Wall Street expectations and softening economic conditions.

A better way to visualize this idea is to look at the correlation between the annual change in earnings growth and inflation-adjusted GDP. There are periods when earnings deviate from underlying economic activity. However, those periods are due to pre- or post-recession earnings fluctuations. Currently, economic and earnings growth are very close to the long-term correlation.

Heading into 2025, real personal consumption expenditures (PCE) remain above real retail sales. While such deviations can occur, they tend not to remain that way long, given that retail sales comprise about 40% of PCE. Such suggests that in 2025, PCE will begin to converge with retail sales, resulting in slower economic growth rates.

Real PCE vs Real GDP & Retail Sales

The following graph visualizes the plight of the average American by showing the *gap* between the cost of living and income and savings. To fund the current cost of living, consumers must spend all of their income and savings and then subsidize the remainder with almost \$4000 in debt annually. This is why total consumer debt continues to rise, which does sustain economic activity in the near term. However, the longer-term impact is slower economic growth as consumers cannot take on excess debt. Also, if interest rates remain elevated, the impact on economic growth is exacerbated.

So, if economic growth slows next year, as the Federal Reserve expects, why is Wall Street so optimistic?

Why Is Wall Street Always Optimistic?

When Wall Street wants to make a stock offering for a new company, it has to sell that stock to someone to provide its client, the company, with the funds it needs. The Wall Street firm also makes a very nice commission from the transaction.

Generally, these publicly offered shares are sold to the firm's biggest clients, such as hedge funds, mutual funds, and other institutional clients. But where do those firms get their money? From you.

Whether it is the money you invested in your mutual funds, 401k plan, pension fund, or insurance annuity, you are at the bottom of the money-grabbing frenzy. **It's much like a pyramid scheme? all the players above you are making their money from you.**

In a study by Lawrence Brown, Andrew Call, Michael Clement, and Nathan Sharp, it is clear that Wall Street analysts are not interested in you. The study surveyed analysts from major Wall Street firms to understand what happened behind closed doors when research reports were being put together. In an interview with the researchers, John Reeves and Llan Moscovitz wrote:

?Countless studies have shown that the forecasts and stock recommendations of sell-side analysts are of questionable value to investors. As it turns out, Wall Street sell-side analysts aren't primarily interested in making accurate stock picks and earnings forecasts. Despite the attention lavished on their forecasts and recommendations, predictive accuracy just isn't their main job.?

The chart below is from the survey conducted by the researchers, which shows the main factors that play into analysts' compensation. What analysts are paid to do is quite different from what retail investors think they do.

Table 5 Survey responses to the question:
How important are the following to your compensation?

Responses		% of respondents who answered		
		Very Important (5 or 6)	Not Important (0 or 1)	Avg. Rating
(1)	Your industry knowledge	72.18	1.93	4.95***
(2)	Your standing in analyst rankings or broker votes	66.85	4.97	4.73***
(3)	Your professional integrity	63.99	3.60	4.69***
(4)	Your accessibility and/or responsiveness	63.54	2.21	4.73***
(5)	Your relationship with management of the companies you follow	44.63	7.16	4.14***
(6)	Your success at generating underwriting business or trading commissions	44.20	20.17	3.65***
(7)	Your written reports	38.95	2.76	4.17***
(8)	The profitability of your stock recommendations	35.08	5.52	3.94***
(9)	The accuracy and timeliness of your earnings forecasts	24.10	7.76	3.59***
Total possible N = 363				

Column 1 (2) presents the percent of respondents indicating importance level of 5 or 6 (0 or 1). Column 3 reports the average rating where higher values correspond to greater importance. Column 3 also reports the results of a t-test of the null hypothesis that the average response is equal to 3, the midpoint of the range of potential responses, with ***, **, and * indicating rejection at the 1%, 5% and 10% levels, respectively.

?Sharp and Call told us that ordinary investors, who may be relying on analysts' stock recommendations to make decisions, need to know that accuracy in these areas is not a priority.?One analyst told the researchers:

?The part to me that's shocking about the industry is that I came into the industry thinking [success] would be based on how well my stock picks do. But a lot of it ends up

being ?What are your broker votes???

A ?broker vote?�is an **internal process**�whereby clients of the sell-side analysts? firms assess the value of their research and decide which firms? services they wish to buy. This process is crucial to analysts� **because good broker votes result in revenue for their firm.**�One analyst noted that broker votes�?directly impact my compensation and directly impact the compensation of my firm.??

You Aren't Important

The question becomes, ?If the retail client is not the firm?s focus, then who is??� The survey table below clearly answers that question.

Table 4 Survey responses to the question:
How important are the following clients to your employer?

Responses	% of respondents who answered		
	Very Important (5 or 6)	Not Important (0 or 1)	Avg. Rating
(1) Hedge Funds	81.49	2.21	5.26***
(2) Mutual Funds	80.11	1.66	5.24***
(3) Defined-benefit pension funds	36.84	16.62	3.61***
(4) Insurance firms	29.89	20.67	3.31***
(5) Endowments and foundations	22.22	26.39	2.96
(6) High net-worth individuals	18.23	41.61	2.41***
(7) Retail brokerage clients	13.30	51.52	1.89***

Total possible N = 362

Column 1 (2) presents the percent of respondents indicating importance level of 5 or 6 (0 or 1). Column 3 reports the average rating where higher values correspond to greater importance. Column 3 also reports the results of a t-test of the null hypothesis that the average response is equal to 3, the midpoint of the range of potential responses, with ***, **, and * indicating rejection at the 1%, 5% and 10% levels, respectively.

Not surprisingly, you are at the bottom of the list. The incestuous relationship between companies, institutional clients, and Wall Street is the root cause of the ongoing problems within the financial system.�**It is a closed loop portrayed as a fair and functional system; however, it has become a ?money grab?**�that has corrupted the system and the regulatory agencies that are supposed to oversee it.

How We Are Trading It

Why am I telling you this? To be a better long-term investor, you must understand the game you are playing and where you get your information.

As I have stated, neither we nor anyone else knows how 2025 will turn out. While I would bet against the bulls, there is always the risk of disappointment.

However, **Wall Street is incentivized to keep you invested, as that is how they make money. There is nothing wrong with that as long as you understand the game.** What is essential to know is that analysts are often wrong in their assumptions, and they revise those assumptions along the way. Therefore, the advice you acted on previously is no longer valid. Notably, while the analysts' revised estimates will eventually be correct, it does little to offset the initial investment risk you took under previously wrong information.

Such is why having a very defined set of trading rules can help offset the risk of wrong information over time. These rules won't offset all your investment risk, nor will they ensure absolute profitability in all scenarios. However, they provide a framework to mitigate the risk of a catastrophic outcome that permanently impairs your capital.

The Rules

1. **Cut losers short and let winners run.** (Be a scale-up buyer.)
2. **Set goals and be actionable.** (Without specific goals, trades become arbitrary.)
3. **Emotionally driven decisions void the investment process.** (Buy high/sell low)
4. **Follow the trend.** (80% of portfolio performance is determined by the long-term, monthly trend. While a rising tide lifts all boats, the opposite is also true.)
5. **Never let a trading opportunity turn into a long-term investment.** (Refer to rule #1. All initial purchases are trades until your investment thesis is proved correct.)
6. **An investment discipline does not work if it is not followed.**
7. **Losing money is part of the investment process.** (If you are not prepared to take losses when they occur, you should not be investing.)
8. **The odds of success improve significantly when the technical price action confirms the fundamental analysis.** (This applies to both bull and bear markets)
9. **Never, under any circumstances, add to a losing position.** (Only losers add to losers. ? Paul Tudor Jones)
10. **Markets are either bullish or bearish.** During a bull market, be only long or neutral. During a bear market, be only neutral or short. (Bull and Bear markets are determined by their long-term trend.)
11. **When markets are trading at, or near, extremes do the opposite of the herd.**
12. **Do more of what works and less of what doesn't.** (Traditional rebalancing takes money from winners and adds it to losers. Rebalance by reducing losers and adding to winners.)
13. **Buy and Sell signals are only useful if implemented.** (Managing without a buy/sell discipline is designed to fail.)
14. **Strive to be a .700 at bat player.** (No strategy works 100% of the time. Be consistent, control errors, and capitalize on opportunities to win.)
15. **Manage risk and volatility.** (Control the variables that lead to mistakes to generate returns as a byproduct.)

Relative Performance Analysis

In last week's newsletter, we noted that we saw much of the rebalancing process occur as expected, and now the market is mostly oversold. That remained the case this past week. One important note is that while it seemed the market was *broadering out* mid-year, that broadening collapsed heading into year-end. Materials gave up all their gains, and more, Real Estate,

Healthcare, Emerging Markets, and Small Caps reversed most of their gains. Once again, the *Mega-Cap* stocks held gains at year-end along with financials. It will be interesting to see if 2025 is a repeat of 2024 or if something does finally change.

Technical Composite

The technical overbought/sold gauge comprises several price indicators (R.S.I., Williams %R, etc.), measured using weekly closing price data. Readings above 80 are considered overbought, and below 20 are oversold. The market peaks when those readings are 80 or above, suggesting prudent profit-taking and risk management. **The best buying opportunities exist when those readings are 20 or below.**

The current reading is 69.98 out of a possible 100.

Portfolio Positioning Fear / Greed Gauge

The Fear/Greed gauge is how individual and professional investors are positioning themselves in the market based on their equity exposure. From a contrarian position, the higher the allocation to equities, the more likely the market is closer to a correction than not. The gauge uses weekly closing data.

NOTE: The Fear/Greed Index measures risk from 0 to 100. It is a rarity that it reaches levels above 90. The current reading is 66.23 out of a possible 100.

MARKET GREED/FEAR INDEX

(AAII, INVI, Bullish Pct, Put/Call, NAAIM, VIX)

Current
Fear/Greed
Index

66.63

The **Fear/Greed Index** is based on a composite of indicators measuring both equity allocation levels (What actions investors are currently taking) and overall sentiment (How investors "feel" about the current market.)

These measures are then combined into a single index that can range from zero (0) to one hundred (100). Readings above 75% are considered extremely bullish with readings below 25% as extremely bearish.

The **"Fear/Greed"** index is a contrarian indicator suggesting that investors "buy" when "extreme fear" is present and "sell" during periods of "extreme greed."

Sector Model Analysis & Risk Ranges

How To Read This Table

- The table compares the relative performance of each sector and market to the S&P 500 index.

- *?MA XVER? (Moving Average Crossover) is determined by the short-term weekly moving average crossing positively or negatively with the long-term weekly moving average.*
- *The risk range is a function of the month-end closing price and the ?beta? of the sector or market. (Ranges reset on the 1st of each month)*
- *The table shows the price deviation above and below the weekly moving averages.*

The sell-off this past week took a majority of sectors, along with bonds, well below their monthly risk ranges. Such sets up those sectors, along with bonds, for a rally into year-end as portfolio window dress their portfolios for year-end reporting. We discussed previously that much of the trading action this past week would be on the downside due to the need for funds to make annual distributions and complete tax loss selling for year-end. That has mostly been completed, giving the market room to rally.

SimpleVisor Portfolio Changes

We post all of our portfolio changes as they occur at [SimpleVisor](#):

Dec 23rd

Trade Alert ? Dividend Equity Model Only

Given the deep oversold condition in the energy sector, we are selling one of our utility stocks and adding to energy. We are also swapping a 3%+ dividend yield for a 4.6% yield. We were overweight in the utilities sector with Edison (ED), so we are swapping ED for KinderMorgan (KMI), which should also benefit from the data center buildout and future power demand increases.

Equity Model

- *Sell 100% of Edison (ED)*
 - *Initiate a 3.33% position in the portfolio with KinderMorgan (KMI)*
-

Lance Roberts, C.I.O., RIA Advisors

Have a happy, safe and prosperous New Year.
