

Viking Analytics: Weekly Gamma Band Update

9/7/2021

We share the Weekly Gamma Bands Update by Viking Analytics. The report uses options gamma to help you better manage risk and your equity allocations.

Gamma Band Update

The S&P 500 (SPX) maintains strength above the gamma flip level last week into the long holiday weekend. We continue to anticipate a muted volatility environment (e.g. a slow grind upward) as long as the SPX remains above the gamma flip level.

The Gamma Band model^[1] is a simplified trend following model that is designed to show the effectiveness of tracking various γ levels. When the daily price closes below Gamma Flip level (currently near 4,480), the model will reduce exposure to avoid price volatility and sell-off risk. If the market closes below what we call the γ lower gamma level (currently near 4,280), the model will reduce the SPX allocation to zero.

The main premise of this model is to maintain high allocations to stocks when risk and corresponding volatility are expected to be low. For investors who have been conditioned to γ buy low and sell high, it is counter-intuitive to increase allocations when the market rises, but this approach has shown to increase risk-adjusted returns in the back-test.

The Gamma Band model is one of several indicators that we publish daily in our SPX Report (click [here](#) for a sample report). Our "Smart Money" Indicator signal remains long, but may be turning cautionary as we head into the fall.

With stocks climbing to historically high valuations, risk management tools have become more important than ever to manage the next big drawdown.

We incorporate many options-based signals into our daily stock market algorithms. Please visit our [website](#) to learn more about our trading and investing tools.

The Gamma Flip - Background

Many market analysts have noted that [daily volatility in the S&P 500 will change](#) when the value of the SPX moves from one gamma regime to another. Some analysts call this level the "gamma flip." The scatterplot below shows how price volatility (on the y-axis) is increasingly lower as the value of SPX rises higher above the Gamma Neutral level (on the right side of the chart). When the value of the S&P closes lower than Gamma Neutral (to the left of the chart), volatility increases;

Gamma Band Model ? Background

The purpose of the Gamma Band model is to show how tail risk can be reduced by following a few simple rules. The daily Gamma Band model has improved risk-adjusted returns by over 60% since 2008. The Gamma Band model approach can limit drawdowns while maintaining the performance of the Gamma Band model.

Gamma Band Historic Information

	sharpe	kurtosis	annual_vol
Gamma Band Return	0.75	7.67	0.10
SPX Return	0.46	12.74	0.21

* Gamma Bands improve backtested Sharpe by: 62.2%
