

Admin Message - New Feature

We added a new feature to SimpleVisor. Under the Ideas tab, you will find Relative Analysis models.

The analysis is based on the price ratio of two securities. We then look at technical indicators of the ratio, as is most often done with a stock price, and assign positive or negative points based on 13 technical indicators. 1.0 is the most bullish possible score but also extremely overbought. Vice versa for a score of -1.0. Often when a score reaches +/- .75, it signals a **relative** trend change is likely.

The first set of analyses compares each S&P 500 sector versus the S&P 500. The sectors are sorted from most oversold (green) to most overbought (red). You can click on each sector for a summary of the ETF as well as a relative analysis of its top ten holdings versus each other and the sector ETF.

The second set of analyses lets the user pick any two securities to compare against each other.

We will be adding more to our relative analysis in the coming weeks, so stay tuned.
