

## TPA Marketscope is showing conflicting alerts (8/14/22)

TPA Marketscope is showing conflicting alerts. The percent of Russell 1000 stocks trading above their 50DMA is now 89%. A reading over 85% is a historical extreme. This is in stark contrast with the longer-term indicator of the percent of stocks trading 50DMA>200DMA, which connotes a long-term uptrend. This alert has been at an extreme for long-term uptrends since 6/26/22. So, it would seem, at first blush, that the market is now short-term overbought and long-term oversold, but TPA states in the Marketscope that the percent of stocks trading above their 50DMA is a very good short-term buy indicator, but is an inconsistent sell indicator.

Clients should be careful, since the S&P500?s RSI stands at 72; indicating this is not the place to be aggressive. Still, given the long-term extreme that still shows stocks being oversold and TPA-RRG?s reports showing a huge shift from value to growth, clients should give the percent of stocks above the 50DMA much less weight. TPA still sees stocks moving higher over time.
