

Viking Analytics: Gamma Band Update 3/13/2023

We share the Weekly Gamma Bands Update by Viking Analytics. The report uses options gamma to help you better manage risk and your equity allocations.

The S&P 500 (SPX) closed nearly 185 points lower on the week ending March 10th, and more than 125 points below the gamma flip level near 3,988.

The gamma band model enters the week with a 30% allocation to the SPX. The model will flip to a full allocation when the slope of the gamma neutral line turns positive. The model will increase to a higher allocation if the market rises and closes above the gamma flip level, currently near 3,988. This model will fall to a 0% allocation if SPX closes below the lower gamma level currently near 3,854.

The chart below shows how price (in black) relates to the gamma flip (in blue) and the lower gamma level (in red). The indicator below the price chart shows the daily positioning allocations.

The Gamma Band model can be viewed as a trend following model that shows the effectiveness of tracking various levels of market gamma. When the daily price closes below Gamma Flip, the model will reduce exposure to avoid price volatility and sell-off risk. There is also an allocation adjustment on the trend slope of the gamma flip line.

Market Navigator Signals

Our Market Navigator Report encapsulates data from the broader market and the economy to provide a near-term outlook for the stock market. At the moment, our signals provide a mixed outlook.

Indicator Name	Current State
